##Data Visualization I

1.Use the inbuilt dataset 'titanic'. The dataset contains 891 rows and contains information about the passengers who boarded the unfo rtunate Titanic ship. Use the Seaborn library to see if we can fin d any patterns in the data.
2.Write a code to check how the price of the ticket (column name: 'fare') for each passenger is distributed by plotting a histogram.

In [1]:
```python
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
```

In [2]:
```python
titanic=sns.load_dataset("titanic")
```

In [3]:
```python
titanic
```

Out[3]:

##Conclusion:

1.THere are more passengers in first that is lower class

2. Age normally distributed

3.Fare is almost left skewed towrards towards

4.The number of old male passenger is more than female passeng
ers

5.There are more young females on ship

6.The females have paid medium to higher ranges of fair.
